

The Czech Geological Survey (CGS), the history of which has started in 1919, has evolved during almost 90 years of its existence into an internationally recognized research institute covering a wide range of geo-scientific topics and services both in the Czech Republic and overseas. The Czech Geological Survey collects and assessed information about the geology of the Czech state territory and provides it to state authorities for their politic, economic and environmental decision-making.

České středohoří Mts and ambient young alkaline volcanic complexes in the Ohře Rift, Czech Republic: volcanology, petrology and rift evolution
Lubomír Kopecký

After a concise appreciation of scientific work of J. E. Hibschi who studied the České středohoří (CS) Mts young alkaline volcanic complex in first half of the past century, this book summarizes and overviews geology, volcanology, petrology and other knowledge on that area which is a part of the Meso-Cenozoic Ohře Rift. A brief view of geology and petrology of the Doupovské hory (DH) Mts and a mutual comparison of both the CS Mts and the DH Mts is presented.

Outline of the Geology of the Bohemian Massif: the Basement Rocks and their Carboniferous and Permian Cover
Jan Cháb et al.

The Bohemian Massif has always been of interest to both Czech and international specialists because it has exposed one of the most remarkable domains of the Variscan orogen. In their work, Jan Cháb and his co-workers provide basic information about the appearance, composition and structure of the Massif, and also about the fossils that have been preserved in its Paleozoic deposits. In the last chapter, the author has attempted to construct a brief scenario of the collision of southern Gondwana and northern Laurussia, based on the most recent data.
