

stavby. Nelze dokonce ani jednotně stanovit minimální počet ploch pro charakterizování radonového indexu dané geologické jednotky o určité velikosti, neboť počet těchto ploch je přímo úměrný nestejnorođnosti geologických poměrů.

Používaná metodika tvorby prognózních map vychází ze zobecnění údajů získaných v rámci celé České republiky. Nemůže se vzhledem k výchozímu měřítku zabývat lokálními údaji o geologické stavbě území. Cílem mapování proto není ani nemůže být vytvoření takového mapového podkladu, který by umožnil odečít přímo kategorie radonového indexu plochy zástavby pro novou výstavbu.

**Poděkování.** Tato práce je výsledkem výzkumu provedeného v rámci projektu VaV č. R/2/2000 zadávaného Státním úřadem pro jadernou bezpečnost.
